Then, Imas want to see data with name "Jus Jambu Merah", she using both of searching methods she knew, which is Linear Search and Binary Search:

Note: Search time can be calculated using the code below, or another algorithm.

```
System.out.println("Mencari Product dengan nama : \"Jus Jambu Merah\" dengan metode Binary Search");
    startTime = System.nanoTime();
    list.binarySearch("Jus Jambu Merah");
    endTime = System.nanoTime();
    waktu = (double) (endTime - startTime)/10000000000.0;
    System.out.printf("Waktu pencarian: %8f detik", waktu);
    System.out.println();
    System.out.println();
```

Rules:

- Sorting methods bubble sort and selection sort
- Searching methods linear search and binary search
- Sort and search the data and compare the time effectiveness of each sorting and searching. (The data compared is 100 data, 200 data, and 300 data)
- Example of comparison results

amount of data	Linear Searching	Binary Searching	Bubble Sorting	Selection Sorting
100	time	time	time	time
200	time	time	time	time
300	time	time	time	time

- Try to use data that is still random.
- Analyze the results of the sorting and searching that has been done, comparing the results of each sorting and searching algorithm. Which algorithm is the most effective and efficient according to the available data for each sorting and searching?
